The paper presents the results of the study of the sensitivity of strains of meningococcus to a number of antibiotics in relation to the presence of a gene coding for the antigen 17. Strains of the capsular type A were shown to exhibit the highest sensitivity to antibiotics. Strains of the capsular type B expressed greater resistance to antibiotics as compared to the capsular type A. The presence of a gene for the antigen 17 in meningococcus strains was shown to produce the greatest influence on the sensitivity of these strains to antibiotics. The genes coding for antigens 17 were identified in strains of two unrelated capsular groups, of type A and B, and on a degree of similarity with the genes coding for the capsular antigens the greater was the sensitivity of the strains to antibiotics. 1 0 2 8 3 9 4 8 1 5 0 * s q r t (7 a1d647c40b
