After Photoshop was first launched, freelance designer Aran Trebes notes, "it became the standard-bearer for Photoshop." That title has stuck, although the platform has had a number of competitors that have been released since. Recently, large firms like Google have sprung up with their own versions, like the free Google Cloud Photo Lab. This, however, is the first free platform. In fact, it is the first public cloud-based image editing platform. And it's also the first to gain a large following and make many inroads in the photo editing market. Adobe Photoshop may have been the first, but Pixlr Photo Editor is the first to replace it as the go-to application for creating photo editing jobs for the masses. To say that the platform is rocking the industry is an understatement. It is arguably the most downloaded and in-demand photo editing tool in recent memory. In 2017 alone, Pixlr has been downloaded over 70 million times. Pixlr is free, has been downloaded over 70 million times, and received 10 awards in just 3 years of existence. An enterprising young developer by the name of Sergio Fonte recently released Pixlr 3.0 to build upon the platform's initial release. Pixlr as a whole has seen a lot of development behind it. In March 2015, the online photo editing tool maker released Pixlr 3.0. It was still relatively bare bones, but it was enough to excite users. Since then, the platform has grown and developed at a rapid pace. The product was recently updated to version 3.5, which is now a free update. The editor now comes with a suite of new features, such as Anti-Aliasing, Artboards, Image Galleries, and a few other improvements. It also gained a few new filters. It is easy to see why Pixlr is up and trending. The tools are straightforward and intuitive. Pixlr has hundreds of filters to do just about anything. You can even create your own filters if you like. "The built-in filters let you fix every problem you might encounter on a photo," writes Wired. "The tool also has a few extra functions that get rid of glare, whiten teeth, remove red eye, adjust contrast, and increase saturation. And of course, it has the comprehensive selection tools you'd expect from any photo editing program." Pixlr 3.5 also includes a new feature

All-cause mortality in bipolar disorder patients: a meta-analysis of cohort and cross-sectional studies. Evidence suggests that patients with bipolar disorder (BD) have increased mortality compared to the general population. However, the extent to which this increased mortality is due to the severity of illness is unclear. To quantify the effect of BD on all-cause mortality by evaluating the association between BD and all-cause mortality using a meta-analysis of cohort and cross-sectional studies. We identified all studies comparing all-cause mortality rates in patients with BD compared to either the general population or a control group of similar size. Eighteen studies were identified; eight studies were cross-sectional and ten were cohort. BD patients had a non-significantly higher risk of mortality compared to the general population (hazards ratio (HR) = 1.25, 95% CI = 0.95, 1.64, p = 0.11). Subgroup analyses (diagnosis, age of onset, setting, study design) revealed no meaningful effect on risk of mortality. However, risk was increased by four times in patients with manic episodes compared to the general population (HR = 4.03, 95% CI = 1.68, 10.0, p = 0.003). There is no increased risk of mortality in the general population compared to patients with BD, however, if patients with manic episodes are excluded from the analysis, a small and nonsignificant excess risk of mortality is observed in patients with BD.

Last night, Paris Mayor Anne Hidalgo saw much-needed rain. In a later tweet, the mayor reported the city had added 5,000 trees to its already extensive network of parks and green spaces. Hidalgo said her work on expanding the green spaces was "paying off." Hundreds of thousands of Parisians enjoyed their first day of spring yesterday as the usually cold and rainy weather gave way to beautiful, warm

Researchers at the Salk Institute for Biological Studies have found a new type of stem cell, which they say can potentially grow into replacement tissues for the brain, spinal cord, heart, liver, limbs, and other organs. In work published online this week in the Proceedings of the National Academy of Sciences, Salk researchers used a revolutionary new technique to grow the cell types that can become replacement tissues outside the body. This technique enables researchers to turn any patient's skin cells into this so-called induced pluripotent stem (iPS) cell, a form of self-renewing stem cell similar to embryonic stem cells. "When a person gets an injury to a limb, heart or brain, stem cells turn on to replace damaged tissues," says senior author Dan Dirks, M.D., Ph.D., director of the Gene Expression Laboratory at the Salk Institute and the Institute's Senior Scientist. "But these normally replace damaged tissues in the body. The cells can't replace damaged tissues in the head because of the blood-brain barrier." "The stem cells we found can form different tissues outside the body and also repair other tissues damaged by injury or disease," adds first author Peng Xie, Ph.D., a postdoctoral researcher at the Salk. Stem cells can repair tissues throughout the body, but they have so far only been used to repair heart and nerve cells. These are the same cells scientists have typically used to treat patients, such as heart-transplant patients or those with blood-vessel diseases. "The stem cells we created in this study can repair any cells in the body; to repair a diseased heart, we would simply inject the cells into the heart or infuse them through an artery to repair damaged heart muscle. The stem cells would connect to and repair the heart muscle," says first author Peng Xie, Ph.D. "Our work shows that we can use these reprogrammed cells to repair any cell type in the body, not just heart and nerve cells." For the study, Salk researchers used a new technique to grow iPS cells from a person's skin cells. The Salk's stem cell technique enables stem cells to be created from any individual's skin cells in the lab with the minimum of time and materials. "We generate iPS cells just by adding chemicals to
