The content of these files comes from a database, but the content is the same for every file. So basically I want to update the contents of all the files. What is the best way to do this? This is a asp.net application. I was looking into using OutofProc and changing the web.config file that is currently the out of proc process. Is there a better way to do this? I was also thinking about xml somehow, I'm not sure if this is possible. Any pointers in the right direction would be much appreciated. A: You can do it by change content of just one file using WebDAV or REST API. For WebDAV you will need to edit Web.Config to make it work. I have done that for my application and it worked. .
